WATER TREATMENT PRODUCTS

## How a Water Softener Works

Water softeners use resin beads that attract minerals from water as it flows through the softener tank. During the regeneration process, these minerals are flushed from the system with no chemicals used. You will taste and feel your water improvement immediately!

**WATER TREATMENT SYSTEMS**

# Let Our *Signature Series*™ Control Valve Do All The Work

Programming is as Easy as Setting the Time of Day & Water Hardness!

## The *Signature Series*™ Control Valve

- 12 Volt DC operation
- 5 fully adjustable cycles
- Easy programming
- 5 year limited warranty
- Choose demand regeneration or timelock option
- 9 Volt Battery back-up
- Cycle position indicator

## Sizing CSI Water Softeners

Sizing your softener is easy! Your CSI dealer or contractor will test your water, analyze the hardness level and determine the proper softener size for your home. The valve controls are adjusted based on your home's water hardness level.

### Soft Water is Better

#### Hard water

- Contains dissolved solids such as calcium and magnesium
- Causes build-up in pipes and hot water tanks
- Leads to higher energy use
- Requires more soap, detergent and shampoo to get things clean

#### Soft Water

- Reduces build-up in pipes
- Prevents soap build-up on tubs, showers and sinks
- Gives skin and hair a silky look and feel
- Keeps clothing colors brighter for longer life
- Allows appliances to run more efficiently

### Softener Systems

Fully automatic or demand meter systems are available in both tank and cabinet configurations. The **Signature Series™** control valve is used to maintain both systems. CSI offers three options of softener systems:

- Standard valve head with timing device regeneration
- Metered valve regeneration based on water usage and softener size
- Alternating twin system with two resin tanks, one in use and one reserve, for a continuous supply of soft water

# Water Softener & Filter Systems

## Eliminatr™ Water Softeners

The **Eliminatr™** employs a special mesh cation exchange resin that gives it a much higher capacity for hardness and iron reduction. The new technology Vortech tank is used to allow high flow volume and reduce pressure drop. In addition, the **Eliminatr™** uses less water and has more capacity per pound of salt than traditional systems.

## Alternating Twin Water Softeners

The versatile **Alternating Twin** Softener employs one tank while the other remains in stand-by mode. When the integral water meter indicates regeneration is needed, the second tank comes on-line while the first tank regenerates. This allows for an uninterrupted soft water supply. The newly regenerated tank is now in standby mode until the meter triggers the next cycle. There's no doubt that CSI Alternating Twin Softeners are the finest in the industry!

## Whole House and Upflow Filters

**Signature Series™** automatic filters and basic up-flow water filters are available for homes with elevated quantities of sediment or other contaminants. Filters can work alone or in tandem with another CSI product.
